LTC3490

## Single Cell 350mA <br> LED Driver

## feATURES

- 350 mA Constant Current Output
- 2.8 V to 4 V Output Compliance
- 1- or 2-Cell NiMH or Alkaline Input
- Synchronous Rectification: Up to 90\% Efficiency
- Fixed Frequency Operation: 1.3 MHz
- Low Quiescent Current: <1mA
- Very Low Shutdown Current: <50 A
- Open LED Output Limited to 4.7V
- $\mathrm{V}_{\text {IN }}$ Range: 1 V to 3.2 V
- Dimming Control
- Undervoltage Lockout to Protect Batteries
- Low Profile ( 0.75 mm ) $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ Thermally Enhanced 8-Lead DD and S8 Packages

## APPLICATIONS

- Portable Lighting
- Rechargeable Flashlights

## DESCRIPTIOn

The LTC ${ }^{\circledR} 3490$ provides a constant current drive for 1W LED applications. It is a high efficiency boost converter that operates from 1 or 2 NiMH or alkaline cells and generates 350 mA of constant current with up to 4 V of compliance. It contains a $100 \mathrm{~m} \Omega$ NFET switch and a $130 \mathrm{~m} \Omega$ PFET synchronous rectifier. The fixed switching frequency is internally set to 1.3 MHz .

The LTC3490 limits the output voltage to 4.7 V if the output load is disconnected. It also features an analog dimming capability that reduces the drive current proportional to the CTRL/SHDN pin voltage. A low-battery logic output signals when the battery has dropped below $1 \mathrm{~V} /$ cell. An undervoltage lockout circuit shuts down the LTC3490 when the battery voltage drops below $0.85 \mathrm{~V} / \mathrm{cell}$. The feedback loop is internally compensated to minimize component count.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: The LTC3490 is guaranteed to meet performance specifications from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$. Specifications over the $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ range are assured by design, characterization and correlation with statistical process controls.
Note 3: The LTC3490 input voltage may drop below the minimum start-up voltage once the LED voltage has risen above 2.3 V .

Note 4: This device includes overtemperature protection intended to protect the device during momentary overload conditions. The maximum junction temperature may be exceeded when overtemperature protection is active. Continuous operation above the specified maximum operating junction temperature may result in device degradation or failure.
Note 5: The Exposed Pad of the DFN package must be soldered to a PCB pad for optimum thermal conductivity. This pad must be connected to ground.

## PIn functions

CELLS (Pin 1): A logic input to set the low-battery and undervoltage shutdown thresholds. A logic low (tied to GND) will set the thresholds for 1 cell. A logic high (tied to $V_{\text {IN }}$ ) will set the thresholds for 2 cells.
$V_{\text {IN }}$ (Pin 2): Supply Voltage.
SW (Pin 3): Switch Input. Connect this pin to an external inductor from $\mathrm{V}_{\text {IN }}$.

GND (Pin 4): Circuit Ground.
LED (Pin 5): Output Drive Current to LED.
CAP (Pin 6): Filter Capacitor. A 4.7 $\mu$ F low ESR capacitor should be tied to this pin.
LOBAT (Pin 7): Low active, open-drain logic output indicating a low-battery condition.

CTRL/SHDN (Pin 8): Analog Control Voltage and Shutdown. When $\mathrm{V}_{\text {IN }} \bullet 0.2<\mathrm{V}_{\text {CTRL }}<\mathrm{V}_{\text {IN }} \bullet 0.9$, the LED drive current varies according to the formula:

$$
\mathrm{L}_{\mathrm{LED}}=500 \cdot\left(\frac{\mathrm{~V}_{\mathrm{CTRL}}}{\mathrm{~V}_{\text {IN }}}-0.2\right) \mathrm{mA}
$$

When $\mathrm{V}_{\text {CTRL }}>\mathrm{V}_{\text {IN }} \bullet 0.9$, the LED drive current is clamped at 350 mA . When $\mathrm{V}_{\text {CTRL }}<\mathrm{V}_{\text {IN }} \bullet 0.2$, then the part is in low power shutdown.
Exposed Pad (Pin 9, DD Package): Ground. This pin must be soldered to the PCB to provide both electrical contact to ground and good thermal contact to the PCB.

## functional piagram

## OPERATION

The LTC3490 is a high efficiency, constant current source for 1W high intensity white LEDs. These high intensity LEDs require a fixed current of 350 mA with a voltage compliance of 2.8 V to 4 V .
The LTC3490 operates with 1 or 2 NiMH or alkaline cells. It functions as a boost converter with a current sense resistor providing the control feedback. If the battery voltage is greater than the required LED compliance, it will cycle off periodically to maintain the correct average current. It features a low voltage start-up circuit that will start with an input voltage of only 1 V . Once the drive voltage exceeds 2.3 V , the circuit operates from the drive voltage.

All of the loop compensation is internal; only the main filter capacitor is needed for stable operation.

## Dimming Function

During normal operation with the CTRL/SHDN pin connected to $\mathrm{V}_{\mathrm{IN}}$, the LED drive current is controlled at 350 mA . The drive current can be reduced by changing the voltage on the CTRL/SHDN pin.
For $\mathrm{V}_{\text {IN }} \cdot 0.2<\mathrm{V}_{\text {CTRL }}<\mathrm{V}_{\text {IN }} \cdot 0.9$, the LED current is proportional to $\mathrm{V}_{\text {CTRL }} \mathrm{V}_{\text {IN }}$. This allows a simple potentiometer from $\mathrm{V}_{\text {IN }}$ to control the current without sensitivity
to the battery voltage. The LED drive current is given by the formula:

$$
\mathrm{L}_{\mathrm{LED}}=500 \cdot\left(\frac{V_{\mathrm{CTRL}}}{V_{\text {IN }}}-0.2\right) \mathrm{mA}
$$

When $\mathrm{V}_{\text {CTRL }}>\mathrm{V}_{\text {IN }} \bullet 0.9$, the LED drive current is clamped at 350 mA .

## Open-Circuit Protection

Since this is a boost converter attempting to drive a current into the load, an open orhigh impedance load will cause the regulator loop to increase the output voltage in an effort to achieve regulation. To protect the device, maximum output voltage is limited to 4.7 V under all conditions.

## Undervoltage Sense and Protection

The undervoltage lockout prevents excessive inductor peak current and protects the batteries from deep discharging which can damage them. The low-battery indicator allows the end user to be made aware that the batteries are nearing the end of their useful life.

## APPLICATIONS INFORMATION

The LTC3490 requires only four external components to operate: an inductor, an output capacitor, a switch and a pull-down resistor. The inductor is nominally set at $3.3 \mu \mathrm{H}$ and the capacitor at $4.7 \mu \mathrm{~F}$. Optional components include an input capacitor and dimming resistors.

## COMPONENT SELECTION

## Inductor Selection

The high frequency operation of the LTC3490 allows the use of small surface mount inductors. The minimum inductance value is proportional to the operating frequency and is limited by the following constraints:

and

$$
\mathrm{L} \geq \frac{\mathrm{V}_{\text {IIN(MIN) }} \cdot\left(\mathrm{V}_{\text {OUT(MAX })}-\mathrm{V}_{\text {IN(MIN) }}\right)}{\mathrm{f} \bullet \text { Ripple } \bullet \mathrm{V}_{\text {OUT(MAX) }}} \mathrm{H}
$$

where:
f = Operating Frequency (Hz)

Ripple = Inductor Current Ripple (A)
$\mathrm{V}_{\operatorname{IN}(\mathrm{MIN})}=$ Minimum Input Voltage (V)
$\mathrm{V}_{\text {OUT(MAX) }}=$ Maximum Output Voltage (V)
The inductor current ripple is typically set to $20 \%$ to $40 \%$ of the inductor current.
The peak inductor current is given by:

$$
\begin{aligned}
I_{\text {LPK }}=I_{\text {OUT }} & \frac{\left(V_{\text {OUT }}+\mathrm{I}_{\text {OUT }} \bullet R_{P}\right)-R_{N} \bullet I_{\text {IN }}}{V_{\text {IN }}-R_{N} \bullet I_{I N}} \\
& +\frac{\mathrm{V}_{\text {IN }}\left(\mathrm{V}_{\text {OUT }}-\mathrm{V}_{\text {IN }}\right)}{2 \bullet L \bullet f \cdot \mathrm{~V}_{\text {OUT }}}
\end{aligned}
$$

where:

$$
\begin{aligned}
& V_{\text {IN }}=\text { Input Voltage }(\mathrm{V}) \\
& \mathrm{V}_{\text {OUT }}=\text { Output Voltage }(\mathrm{V}) \\
& \mathrm{I}_{\text {OUT }}=\text { LED Drive Current }(\mathrm{A}) \\
& \mathrm{I}_{\text {IN }}=\text { Input Current }=\mathrm{V}_{\text {OUT }} / \mathrm{V}_{\text {IN }} \bullet \mathrm{I}_{\text {OUT }}(\mathrm{A}) \\
& \mathrm{R}_{\mathrm{P}}=\mathrm{R}_{\text {DSON }} \text { of the PFET Switch }(\Omega) \\
& \mathrm{R}_{\mathrm{N}}=\mathrm{R}_{\text {DSON }} \text { of the NFET Switch }(\Omega)
\end{aligned}
$$

For high efficiency, choose an inductor with a high frequency core material, such as ferrite, to reduce core losses. The inductor should have low ESR (equivalent series resistance) to reduce the $I^{2} \mathrm{R}$ losses and must be able to handle the peak inductor current at full load without saturating. In single cell applications, the inductor ESR must be below $25 \mathrm{~m} \Omega$ to keep the efficiency up and maintain output current regulation. Dual cell applications can tolerate significantly higher ESR (up to $75 \mathrm{~m} \Omega$ ) with minimal efficiency degradation. Molded chokes or chip inductors usually do not have enough core to support the peak inductor currents in the 1A to 2A region. If radiated noise is an issue, use a toroid, pot core or shielded bobbin inductor to minimize radiated noise. See Table 1 for a list of suggested inductors. Look closely at the manufacturers data sheets; they specify saturation current differently.
Table 1. Inductor Information

| INDUCTOR PART NUMBER | ESR (m $\Omega$ ) | SATURATION CURRENT (A) |
| :--- | :---: | :---: |
| TOKO A918CY-3R3M | 47 | 1.97 |
| TYCO DN4835-3R3M | 58 | 2.15 |
| TDK SLF7045T-3R3M2R5 | 20 | 2.5 |

## Output Capacitor Selection

The output capacitor value and equivalent series resistance (ESR) are the primary factors in the output ripple. The output ripple is not a direct concern for LED drive as the LED will operate at the average current value. However the peak pulsed forward current rating of the LED must not be exceeded to avoid damaging the LED.

## APPLICATIONS INFORMATION

The output ripple voltage has two primary components. The first is due to the value of the capacitor and is given by:

$$
\mathrm{VR}_{\mathrm{CAP}}=\frac{\mathrm{L}_{\mathrm{LPK}} \bullet \mathrm{~V}_{\mathrm{IN}}}{\mathrm{C} \cdot \mathrm{~V}_{\text {OUT }} \bullet f}
$$

The second is due to the capacitor ESR:

$$
V R_{E S R}=I_{L P K} \bullet R_{E S R}
$$

The LED current ripple and peak pulsed current are calculated by:

$$
\begin{aligned}
& I R_{\text {LED }}=\frac{V R_{\text {CAP }} \bullet V R_{E S R}}{R_{\text {SENSE }}+R_{\text {LED }}} \\
& I_{\text {PPFC }}=I_{\text {OUT }}+\frac{I R_{\text {LED }}}{2}
\end{aligned}
$$

where:

$$
\mathrm{R}_{\text {SENSE }}=\text { Internal Sense Resistor }=0.1 \Omega
$$

$R_{\text {LED }}=$ Dynamic Impedance of the LED
Low ESR capacitors should be used to minimize output ripple. Ceramic X5R or X7R type capacitors are recommended. See Table 2 for a list of component suppliers.

Table 2. Capacitor Information

| CAPACITOR PART NUMBER | DESCRIPTION |
| :--- | :--- |
| TDK C2012X5R0J475K | $4.7 \mu \mathrm{~F}, 6.3 \mathrm{~V}, \mathrm{X} 5 \mathrm{R}$ in 0805 |
| AVX 1210ZC475MAT | $4.7 \mu \mathrm{~F}, 10 \mathrm{~V}, \mathrm{X7R}$ in 1210 |
| Taiyo Yuden CELMK316BJ475ML | $4.7 \mu \mathrm{~F}, 10 \mathrm{~V}, \mathrm{X} 7 \mathrm{R}$ in 1206 |

## Input Capacitor Selection

Most battery-powered applications do not need an input capacitor. In supply-powered applications or battery applications with long leads to the battery, a low ESR $3.3 \mu \mathrm{~F}$ capacitor reduces switching noise and peak currents.

## Design Example

The example will use a Lumileds DS25 white LED. The key specifications are:
$V_{F}\left(\right.$ at $\left.I_{F}=350 \mathrm{~mA}\right)=3.4 \pm 0.6 \mathrm{~V}$
$R_{\text {LED }}=1 \Omega$
Peak Pulsed Forward Current $=0.5 \mathrm{~A}$

Component values will be calculated for 1 or 2 NiMH cells and assumes the end-of-charge voltage to be 0.9 V per cell. The operating frequency is assumed to be 1 MHz , the worst-case low frequency. The allowed inductor ripple current is 0.31 A . Table 3 shows a summary of the key parameters.
Table 3. Summary of Key Parameters

| PARAMETER | 1-CELL | 2-CELL | UNITS |
| :--- | :---: | :---: | :---: |
| LIIN | 2.2 | 3.2 | $\mu \mathrm{H}$ |
| Choose L | 3.3 | 3.3 | $\mu \mathrm{H}$ |
| $\mathrm{I}_{\mathrm{IN}}$ | 1.56 | 0.78 | A |
| $\mathrm{I}_{\text {LPK }}$ | 1.93 | 0.96 | A |
| Choose C | 4.7 | 4.7 | $\mu \mathrm{~F}$ |
| Cap ESR | 5 | 5 | $\mathrm{~m} \Omega$ |
| VR | CAP | 0.09 | 0.09 |
| VR | 0.01 | 0.005 | V |
| $\mathrm{IR}_{\text {LED }}$ | 0.10 | 0.09 | V |
| $\mathrm{I}_{\text {PPFC }}$ | 0.40 | 0.39 | A |

where:
$l_{\text {LPK }}$ is the peak inductor current
VR $_{\text {CAP }}$ is the ripple voltage due to the output capacitor value
$\mathrm{VR}_{\mathrm{ESR}}$ is the ripple voltage due to the output capacitor ESR
$\mathrm{IR}_{\text {LED }}$ is the LED current ripple
IPPFC is the LED peak pulsed forward current

## PC Board Layout Checklist

Keep the inductor and output capacitor as close to the IC as possible. Make traces as short and wide as is feasible. Parasitic resistance and inductance reduce efficiency and increase ripple.
Keep resistance in the battery connections as low as possible. In single cell applications, only $0.1 \Omega$ in the battery connections will have a dramatic effect in efficiency and battery life. $I^{2} \mathrm{R}$ losses can exceed 100 mW and the converter operates lower on the efficiency curve.

## APPLICATIONS INFORMATION

## Red Luxeon LEDs

The red, red-orange and amber Luxeon LEDs have a lower forward voltage than the white, blue and green LEDs. Since the LTC3490 internal circuitry is powered from the output, it requires a minimum LED voltage of 2.5 V for reliable operation. The minimum forward voltage on the red LEDs
is only 2.31 V . The LTC3490 requires an additional 190 mV for proper operation. In non-dimming applications, this can be accomplished with a $0.6 \Omega$ resistor in series with the LED. The resistor voltage drops too low in dimming applications, so a Schottky diode is recommended to keep sufficient voltage at the output at lower currents.
