### 5.0 Derating Curve:

Resistors shall have a power rating based on continuous load operation at an ambient temperature from $-55^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$. For temperature in excess of $70^{\circ} \mathrm{C}$, the load shall be derate as shown in figure 1

Figure1

5.1 Voltage rating:

Resistors shall have a rated direct-current (DC) continuous working voltage or an approximate sine-wave root-mean-square (RMS) alternating-current (AC) continuous working voltage at commercial-line frequency and waveform corresponding to the power rating, as determined from the following formula:

$$
R C W V=\sqrt{P \times R}
$$

Where: RCWV = Rated DC or RMS AC continuous working voltage at commercial-line frequency and waveform (VOLT.)
$P=$ power rating (WATT.) $\quad R=$ nominal resistance (OHM)
The overload voltage is 2.5 times RCWV or Max. Overload voltage whichever is less.
